[7] Body stores vitamin E in fatty tissue and the liver.

[8] Most fat stored in the human body is subcutaneous (which means "under the skin"). This layer of fat is made up of fat cells. A thin person still has between 20 and 27 million fat cells, while an overweight person can have anywhere from 75 to 300 billion fat cells distributed around the body.
It's worth bearing in mind that the body doesn't only store fat directly food, as the liver makes further fats from proteins and carbohydrates. These additional fats are made to enable the easy storage of energy in fat cells, and help to explain why a low-fat diet won't necessarily result in you losing weight.
